

One Day Of Your Life - The existentialist moment

Character or personality of individual created in part by conditioning controlling epigenetics and patterning created, then controlled by dynamics of this continuing moment.

NOTE: Existentialist moment has all memory of the unconscious for cellular memory, but is limited for cognitive recall. Magnified in time to show enabling control over the resolute layer and consciously recalled memory.

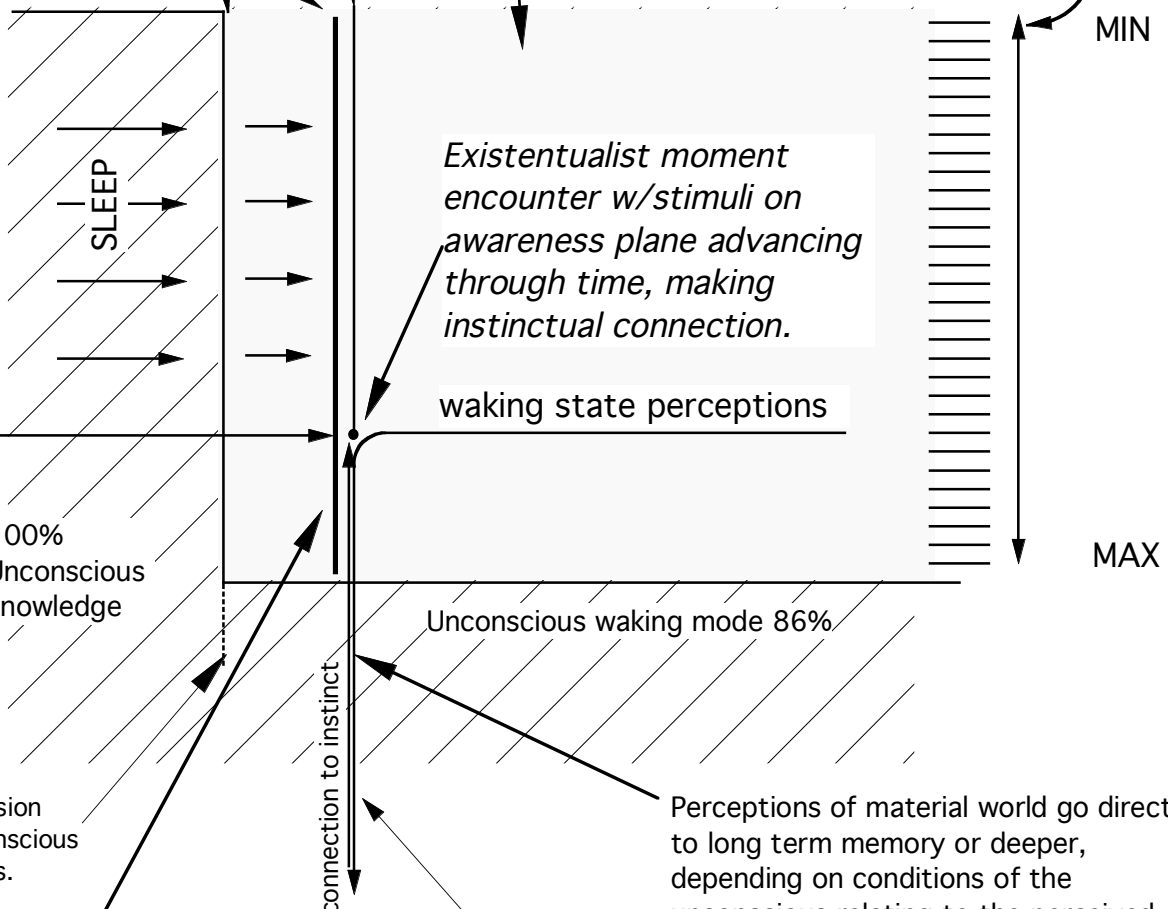

Resolute Barrier:
Enables cognitive decisionary action and sets limits of conscious memory recall.

Perceptual face of the existentialist Plane

Dots represent perceptions, stimuli of material world

Levels of existence unconscious reacts to equates to importance in Maslow Hierarchy of values. Same for sleep as awake.

Observed hypnopompic events are abnormal transition to waking state and creation of resolute layer.

Existentialist moment encounter w/stimuli on awareness plane advancing through time, making instinctual connection.

waking state perceptions

100% Unconscious knowledge

Unconscious waking mode 86%

Societally assumed division between sleeping unconscious and waking unconscious.

Down arrow is perceptions to unconscious, up arrow is control over resolute barrier

Perceptions of material world go direct to long term memory or deeper, depending on conditions of the unconscious relating to the perceived. Association is achieved by the resolute plane and dissociation is controlled at the leading face, both according to instinct. Waking state exceptions of somnambulism depth of trance or other unconscious states, not of sleep, can alter performance of leading face or trailing barrier

NOTE: The depth potential instinctually or the number of instincts the trailing face, the resolute barrier, is controlled by, may be 7 times greater vertically than that represented for the Maslowian hierarchy in this diagram, above and right, as established by research of psychology.
